Create Incident

Key Findings

RCA

Recommendation

Log Evidence

Deployment Status

- **Write latency on AuthDiskSystem crossed 412ms, 2x the 200ms threshold**  
Sustained for 90 seconds across host auth-disk-03

- **Correlates with deploy #4489 to auth-service, 6 minutes prior**  
Deploy touched disk I/O batching config

- **No similar pattern in the last 30 days**  
Ruled out as recurring/known issue

- **Affects auth-service only; no downstream impact detected yet**  
checkout-svc and payments-api unaffected

# New incident

Summary

Templates ▾

High write latency on AuthDiskSystem following deploy #4489, causing degraded auth-service response times.

# P1 — Checkout errors spiking 8x baseline

CRITICAL

checkout-svc · opened 6m ago · owner: SRE on-call

Overview

Key Factors

RCA and Recommendation

Timeline

## AI summary

Error rate on /checkout jumped after 14:02 deploy. Correlates with DB connection pool exhaustion on checkout-db-primary. Confidence 82%.

## Impact

~14,000 customers affected · \$8.2K revenue/min · SLA at risk in 12m

## Investigation timeline

- **Intake Agent** — parsed alert  
14:03:02
- **Log Analysis Agent** — 340 pool errors found  
14:03:18
- **RCA Agent** — 82% confidence  
14:04:01
- Impact Agent — estimating blast radius...

## Root cause hypotheses — checkout-svc P1

### 1. DB connection pool exhaustion after 14:02 deploy

82% confidence

Evidence: 340 pool-exhaustion log entries · deploy diff shows max-connections lowered 200→50 · matches incident #INC-2291 (Mar 2026)

### 2. Downstream dependency (payments-api) slow responses

11% confidence

Evidence: minor p99 latency increase on payments-api, timing doesn't align with error spike

### 3. Traffic surge beyond capacity

7% confidence

Evidence: traffic within normal range for time of day

## Recommended remediation — checkout-svc P1

### Rollback deploy #4471

Low risk

Restores max-connections to 200. Est. resolution: 4 min. Confidence: 82%

### Scale checkout-db pool 200→400

Medium risk

Mitigates without rollback but doesn't fix root cause. Confidence: 45%

### Restart checkout-svc pods

Not recommended

Temporary relief only, pool will exhaust again in ~10 min. Confidence: 20%

## Runbook: DB pool exhaustion — checkout-svc

Manual execution — Phase 1

- 1 Verify current pool utilization**  
kubectl exec into checkout-db-primary, check active connections
- 2 Revert config #4471**  
restores max-connections to 200
- 3 Restart connection pool**  
graceful restart, zero downtime
- 4 Verify error rate < 1% for 5 min**  
manual sign-off required

Starting Retrospective generation for INC-CASE-2323223

## Generate Retrospective using AIR AI BETA

AIR gathers all relevant information from the incident, its linked alerts, and the conversation from its Slack channel, and structures it into a retrospective with the following sections:

1. Key information
2. Timeline
3. Impact
4. Root cause analysis
5. Action items

Which alerts should we take into account?

☒ 4409231 — Checkout error\_rate > 5% for 2m

Which chat channels should we analyze?

# Retrospective: Checkout errors spiking 8x baseline

Generated by AIR AI on 2026-07-12 · INC-CASE-2323223

## Key information

|                   |                                   |
|-------------------|-----------------------------------|
| Affected services | checkout-svc (CRITICAL)           |
| Reported at       | 14:02:40                          |
| Resolved at       | 14:19:00                          |
| Created by        | ArunKumar K (SRE Engineer)        |
| Slack channel     | <a href="#">#inc-case-2323223</a> |

## Impact

~14,000 customers affected · \$8.2K revenue/min · checkout-svc degraded for 16 minutes.

## Action items

- ❑ Add pre-deploy config-diff guardrail for DB pool settings (Owner: Platform team)
- ❑ Alert on pool utilization > 80%, not just error rate (Owner: SRE team)

## Incident timeline

- 14:02:40** — Error rate alert fired
- 14:04:01** — RCA agent identified root cause, 82% confidence
- 14:07:00** — Rollback assigned to on-call engineer
- 14:19:00** — Error rate normalized, incident resolved

## Root cause analysis

Deploy #4471 lowered checkout-db max-connections from 200 to 50, causing pool exhaustion under normal traffic.

Alert rules

New rule

| Condition               | Service      | Severity | Threshold  | Enabled |
|-------------------------|--------------|----------|------------|---------|
| error_rate > 5% for 2m  | checkout-svc | P1       | 5%         | On      |
| p99_latency > 3s for 5m | payments-api | P2       | 3000ms     | On      |
| pod_restarts > 3 in 10m | auth-service | P3       | 3 restarts | Off     |
